

Cadence

Speech and presentation rehearsal lab | Abstract

PROBLEM

Students and job seekers preparing for interviews, presentations, and pitches often receive encouragement without specific feedback about delivery. They need a practical way to identify habits such as filler words, rushed pacing, unclear phrasing, and weak structure while they rehearse.

USERS

Cadence is for people who want to improve a short talk before presenting to a class, committee, hiring panel, or potential investor.

BUILD

The browser app records or uploads a speech and sends it with topic and audience context to a server-side Gemini API. Cadence returns a transcript with labeled segments, delivery metrics, direct coaching, rewrites, and practice drills. Speakers can review session history, replay a local recording during the current browser session, and use voice coaching and drill analysis.

STACK AND DATA

The frontend uses React, TypeScript, and Vite. An Express server calls Google Gemini and stores session analyses in Supabase Postgres as JSONB. A random browser profile ID separates demo sessions; audio is sent for analysis and is not stored in the session database.
